An Overview of Transgender Healthcare for the Primary Care Physician

M. Brett Cooper, MD, M.Ed
Emily Briggs, MD
Aekta Malhotra, MD
William Gilmer, MD
G. Sealy Massingill, MD
Objectives

• Describe the process of gender identity development
• Compare the holistic approach to care for adolescents and young adults versus adults
• Discuss ways for patients and families to advocate for evidence-based transgender healthcare
# Terminology

<table>
<thead>
<tr>
<th>TABLE 1</th>
<th>LGBT nomenclature and definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gender identity</td>
<td>How one labels one’s gender, whether male, female, transgender, or another identity (eg, genderqueer)</td>
</tr>
<tr>
<td>Sexual orientation</td>
<td>Whether someone is primarily attracted to persons of the same sex (homosexual), the opposite sex (heterosexual), or both (bisexual)</td>
</tr>
<tr>
<td>Sexual identity</td>
<td>How one consciously labels one’s sexuality, whether gay, straight, bisexual, or another identity label (eg, queer, bi-curious)</td>
</tr>
<tr>
<td>Sexual behavior</td>
<td>A person may engage in a variety of sexual behaviors with males and/or females or no sexual behavior at all and self-define sexual orientation on another basis</td>
</tr>

Gender Identity Development
Gender Identity Development

• Experimenting with gender roles is NORMAL in pre-school age children

• Kohlberg’s theory of gender development
  • Formation- age 2-3
  • Stability- age 4-5
  • Constancy- age 5-7

• Results of 2015 US Transgender Survey support this
  • By age 10, 60% of respondents reported that they began to feel different from their sex assigned at birth

• Brain structure differences on MRI can be seen

PCP Approach
General Approach

In primary care practice:
- our approach to patients can present its own barrier
- must meet patients where they are
- trauma-informed care
- know your resources
- practical solutions
IRL

Real life experiences

Holistic Approach to Care for Adolescents and Adults
Initial PCP Care

- Patient may not want medical assistance
- Families/patients may have questions
- Menstrual suppression
- Mental health treatment

Adolescents

• New chapter in WPATH Standards of Care 8
• Medical care is NOT initiated until after the onset of biological puberty
• Parents should be involved in decision-making
• Developmental maturity should be assessed
• Other medical/mental health conditions must be addressed
• Many may not want hormonal treatment
Recommendations

- Treatment team has experience in childhood and gender development
- Conduct a multidisciplinary and comprehensive assessment
- Allow open exploration of all identities
- Involve other disciplines where warranted
  - Neuropsychological conditions
- Maintain an ongoing and frequent relationship with patient/family
Adult Care

• Choice for initiating medical care done in an informed consent manner
  • Counseling or psychotherapy is not a requirement
• Can be done in a variety of settings
• Physician or other provider should act as a partner in decisions
Clinician should be trained in gender affirming care
Clinician should be able to assess ability to consent
Clinician should be able to distinguish mental health concerns
Clinician should only recommend treatment when dysphoria is marked and sustained
Gonadectomy should only be considered after 6 months on hormones
Ethical Considerations

- Informed Consent
- Competency/Humility
- Confidentiality and Disclosure
- Bias and Discrimination
- Affirming Gender Identity
Evidence Base
Transgender and Gender Non-Conforming (TGNC) Youth

Odds of mental health outcomes among transgender and nonbinary youths who received gender affirming care vs. those who did not:

- Depression: -60%
- Suicidality: -73%
The Amsterdam Cohort of Gender Dysphoria Study (1972-2015)

- 6,793 people (4,432 birth-assigned male, 2,361 birth-assigned female) sought care at the The Center of Expertise on Gender Dysphoria (CEGD) at the VU University in Amsterdam from 1972 through 2015.

- The number of people assessed per year increased 20-fold from 34 in 1980 to 686 in 2015.

- The estimated prevalence in the Netherlands in 2015 was 1:3,800 for men (transwomen) and 1:5,200 for women (transmen).

- The percentage of people who started HT within 5 years after the 1st visit decreased over time, with almost 90% in 1980 to 65% in 2010.

- The percentage of people who underwent gonadectomy within 5 years after starting HT remained stable over time (74.7% of transwomen and 83.8% of transmen).

- Only 0.6% of transwomen and 0.3% of transmen who underwent gonadectomy were identified as experiencing regret.

- 2023 Update: A substantial number of adolescents did not start medical treatment. In the ones who did, risk for re-transitioning was very low, providing ongoing support for medical interventions in comprehensively assessed gender diverse adolescents.

I worked at the Tavistock gender clinic. This is why closing it was the right move

Good clinical care is about ensuring we can question practices, to exercise caution with new ideas, and to ensure we develop a sound evidence base for any treatments.
In the prominent case of *Keira Bell v Tavistock*, he testified in support of the lower court’s ban on the use of puberty blockers in patients younger than 16 (the appeals court overturned this ban in 2021). In 2022, David Bell unsuccessfully called for the shutdown of Glasgow’s Sandyford gender service clinic, accusing Scottish National Party members of being influenced by “trans ideology.” Bell relies on his authority as a psychoanalyst to generalize any medical transitioning in youth as being incompatible with depth psychotherapy, despite the work of many experts and patients who can attest to the contrary. And he is not alone in doing so.

The *Keira Bell v Tavistock* case was initially brought by Susan Evans, who is a nurse and psychoanalytic psychotherapist. She and her husband, Marcus Evans, a psychoanalyst, resigned from Tavistock in the wake of these events, and have been similarly outspoken in their attempts to curtail patient access to medical transition. Susan and Marcus Evans are featured in the upcoming seminar sponsored by the Gender Exploratory Therapy Association (GETA), a group that suggests medical transition for young people “should be avoided if possible” in favor of an unstudied and dubious psychotherapeutic approach with startling similarities to Sexual Orientation Change Efforts (SOCE, otherwise known as Conversion Therapy).
